

## **Release Notes - Flexicoder: v9 SP4**

---

### **38: Add (none) as value**

An option has been added to not recode selected values in the Assign Segments window.

### **147: Move expansion to side**

The expansion button for the Recoding Methods list on the main Flexicoder window has been moved from the top of the list to a separate expansion button for each line. Users no longer have to click onto the recode method list before they can open the Assign Segments window.

### **2: Increase speed of main screen open**

The main Flexicoder window now opens much faster when using Flexicoder to recode by large numbers of customers or items.

### **3: Change segment entry from string to drop down list**

The segment value has been changed from a segment entry to a drop down list. This prevents entry of invalid segment values. Descriptions of the segments are also displayed in the drop down list to enhance usability.

### **334: Allow recoding on SOP line extender fields**

You can now recode sales transactions based on Extender fields that you have placed on the sales line items.

### **4: Fill segments on Assign Segment window**

A button has been added to the Assign Segments window called Fill Segments. Clicking on this button allows to set a range of segments values.

### **5: View filter on Assign Segment window**

The view filter on the Assign Segment window lets you display all segments, segments that are not being recoded or all blank segments.

### **262: Flexicoder will not recode eConnect transactions**

Transactions that were generated through eConnect were not being recoded before being posted.

## **364: Cannot recode on eXtender fields**

The Flexicoder setup was not saving the recoding settings for Extender fields.
